The Crested gecko originates from the islands of New Caledonia where the species was believed to be extinct until 1994 when it was subsequently rediscovered. In its natural environment, it can be found resting in rainforests, sleeping in trunk hollows or leaf litter, and only becomes active at night. Similar to other geckos, it can shed its tail as a defence mechanism (autotomy), but unlike others it lacks an ability to regenerate the tail, so care should be taken while handling. Geckos may live 15-20 years if looked after correctly. |

- Background heat can be provided with a heat mat (on the back wall) a tubular heater, a heat plate or a ceramic bulb. This should be set on a thermostat so that the overnight temperature does not drop below  $\sim 20^{\circ}\text{C}$ .

We recommend annual health checks every year for pet reptiles as medical problems are more easily treated if detected at an early stage

---

We highly recommend that you take out a pet insurance policy. For a monthly fee your pet can receive the best treatment at an affordable cost. There is normally an excess to pay for each condition then after that costs are covered up to a set limit. Once you have the policy, please provide us with a copy of your insurance details. There are a lot of different companies and policies available and we suggest you contact a number of them for information- we have a leaflet advising what to look out for. Our advice is to choose a policy which provides cover for chronic illness for the life of your pet. If this policy is too much for you then the best cover you can afford will provide piece of mind in an accident or emergency.
